

Challenges of the water crisis in the Mediterranean

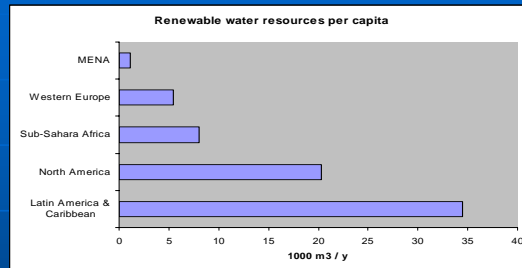

Eric MINO

Euro-Med Information System
on know-how in the water sector

www.emwis.net

Water a scarce & fragile resource

- 60% of the world water poor population

- Unevenly distributed in time and space

- Over exploitation of renewable water and fossil aquifers

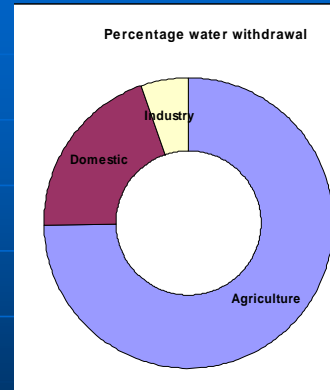

Sources d'approvisionnement en eau (2000 - 2005) en %

Main pressures

- **Coastal areas:**
 - High concentration of urban population
 - 25% of international tourist trade
- **High level of abstraction for agriculture**
 - 70%
- **But growing demand from urban areas**
 - 20%
- **Growing population in South and East Med**
 - About 4% per year
- **Impact of climate change**
 - Water quality damage
 - More demand for agriculture
 - Less quantity

Potential benefits of Demand Management

- **Great potential savings:**
 - 25% of water withdrawal in 2025
 - Agriculture: about 67% of potential savings
- **Increased added value of water**

Demand management in water policies

- **A long experience in management the water scarcity**
 - Water harvesting, reuse, ...
- **A policy goal for almost all countries**
- **But remains secondary to supply measures**

Rain water harvesting
Kerouan moske, XI century

Qualitative review of DM in water management over 10 years, GTZ/ KFW

WWF5 – Side event: Water Resources across Europe – confronting Water Scarcity and Drought, 18 March 2009

Most promising options

- **Water efficiency in irrigation**
 - Water savings between 30% and 50%
 - Increased production
 - Technologies introduced with broader approach: new crops, fertilisers, participatory management
 - Incentives and training
- **Treated waste water reuse**
 - Mainly in urban areas
 - For irrigation purpose
 - In-house recycling of grey-water with incentives
 - Lack of costs/benefits economical analysis
- **Awareness / education campaigns**
 - Usual business of water authorities

WWF5 – Side event: Water Resources across Europe – confronting Water Scarcity and Drought, 18 March 2009

Other lessons

- **Drinking Water supply networks**
 - Constraints due to resource availability (e.g. non permanent water distribution)
 - Reduction of unaccounted-for-water with private water utilities
- **Water valuation to reduce consumption**
 - Difficult for domestic water (low income population)
 - Very limited for agriculture
 - -> largely subsidies (rural development)
 - -> use of non priced resources
 - -> Shift to higher value crops
 - Tourism & industry -> investment in water saving technologies

Main challenges

- **Well balancing supply & demand management**
 - Long term planning for supply investment
- **Local and participative management**
- **Multisectoral approach**
 - Agriculture, industry, tourism, environment (quality, eco-system)
- **Availability of relevant data at the right scale**
